                                                                                                                                                                                                                                                                                             channel protein designated TREK-1. The protein is activated by polyunsaturated fatty acids, particularly at indonce acid, and by riluzole. The protein is used to screen for soft the heart and nervous systems in humans and animals, e.g. epilepsy indiovascular disease (arrhythmia), neurodegeneration (particular), increasing disease. The protein itself may be used to the cretion and muscular disease. The protein itself may be used to the these diseases. Antibodies specific for the protein are used.
                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a mechanical channel protein designated TREK-1. The protein designated TREK-1 acida.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         specific modulate

                                                                                                                                               disorders. Nucleotides encoding K+Hnov proteins may be used for identifying homologous or related proteins at the DNA sequences encoding them. They may be used to produce compositions that modulate the expression and function of the K+Hnov prote; and in studying the biochemical pathways associated with it. They, may also be used for the
                                                                                                                                                                                                                                                                                                  polymorphisms detected as sequence variants by ween multiple independent clones. Potassium channels have controlled in roles in various cell types and biochemical pathways. Defective potassium channels are known to cause four human diseases: episodic a axia with myokymia; cardiac arrhythmia (long OT syndrome); epilepsy; and Bartter's syndrome. As potassium channels are critical component. If virtually all cells, it is likely that abnormal potassium channed are also implicated in certain renal, cardiovascular and central network system (CNS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Wills sequence represent the form of homology to known potassium k+Hnov proteins have a high degree of homology to known potassium channel, channels and may be alpha subunits, which for the functional channel, or accessory subunits that act to modulate the channel activity. K+Hnov59 or accessory subunits that act to modulate the channel activity. K+Hnov59
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             is a 4 transmembrane domain, 2 pore domain. ....ssium channel. is located on chromosome 19, determined via. .....chromosomal localisation using primers AAZI1939 and AAZI1 0. KHHnov cDNAs were isolated by extension of expressed segue e tags (ESTs) where the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the cont

                   polynucleotide AAZ00039. h-TREK1 is a two pore potassium channel, and the gene maps to human chromosome 1q32, between the markers D1S237 and WI5105. The polynucleotide sequence of h-TREK1 can be used to diagnose a disease or susceptibility to a disease related to expression or activity of h-TREK-1 polypeptides. The methods of diagnosis may be used in the treatment of diseases including cancer, pulmonary, cardiovascular, and inflammatory diseases, pain, psychiatric disorders including depression and schizophrenia, neurodegenerative diseases including Alzheimer's,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        schizophrenia, neurodegenerative disease including Alzheimer's, s and head trauma and neurological disorders including migraine and epilepsy. The present sequence is human h-TRAAK protein #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Functional genomics was used to identify h-TRAAK polypeptides and h-TRAAK polypucieotides from human tissue samples. h-TRAAK polypeptides have homology to the 2P domain potassium channel family of polypeptides. The h-TRAAK polypeptides and polynucleotides may be used in diagnostic assays for conditions related to h-TRAAK imbalance and for identifying agonists and antagonists of h-TRAAK polypeptides. The h-TRAAK polypeptides and polynucleotides may also be useful for treatment and prevention (e.g. as vaccines) of certain diseases, such as pain, psychiatric disorders including depression and chiscabers, such as pain, psychiatric disorders including depression and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 12; Pages 21 and 22; 35pp; English

The protein protein designated TRAAK. The protein polyunsaturated fatty acids, particularly a protein cacid, and by riluzole. The protein is used to screen for which heart and nervo systems in humans and animals, e.g. epileps the heart and nervo systems in humans and animals, e.g. epileps the heart and nervo systems in humans and animals, e.g. epileps the heart and nervo disease (arrhythmia), neurodegeneration (particular) the associated with ischemia or anoxia), abnormalities of hormo these diseases. The protein itself may be used to these diseases. Antibodies specific for the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are used to the protein are use

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  BIOL Chem. 275:16969-16978(2000).

- FUNCTION: PH-DEPENDENT, VOLTAGE-INSENSITIVE, BACKGROUND POTASSIT CHANNEL PROTEIN. RECTIFICATION DIRECTION RESULTS FROM POTASSIUM ION CONCENTRATION ON ETHER SIDE OF THE MEMBRANE. ACTS AS AN OUTWARD RECTIFIER WHEN EXTERNAL POTASSIUM CONCENTRATION IS LOW.

WHEN EXTERNAL POTASSIUM CONCENTRATION IS HIGH, CURRENT IS INWARI
                                                                                                                                                                                                                                                                                                                                                                                    SUBUNIT: HOMODIMER (POTENTIAL).

SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN (POTENTIAL).

SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN (POTENTIAL).

TISSUE SPECIFICITY: VERY STRONG EXPRESSION IN HEART, ALSO DETECTED IN KIDNEY, BRAIN, SKIN, TESTIS, LUNG, SKELETAL MUSCLE, SMALL INTESTINE AND STOMACH. NOT DETECTED IN LIVER, THYMUS OR SPLEEN.

MISCELLANEOUS: INACTIVATED BY BARIUM.

SIMILARTIY: BELONGS TO THE TWO PORE DOMAIN FAMILY OF POTASSIUM CHANNELS.
